

Change Management Plan: Psychiatric Discharge Continuity Dashboard

Purpose

The purpose of this dashboard is to improve continuity of care following psychiatric discharge by making coordination risks visible, reducing reliance on case manager memory, and providing structured prompts for outreach, escalation, documentation, and follow-up activities.

Training Strategy

Case Managers

- Conduct a 30-minute live group demonstration of the dashboard.
- Provide a short workflow guide showing how to use alerts, continuity status indicators, outreach tracking, and documentation prompts.
- Allow staff to practice using sample patient scenarios.
- Offer follow-up 1:1 support during the first two weeks of implementation.

Consultants

- Provide a focused 15-minute walkthrough showing how escalated and clinical concern cases appear in their role-specific dashboard view.
- Demonstrate how to review and respond to escalation notifications.

Administrators / CM Leads

- Provide a 20-minute overview of caseload visibility, workload balancing, documentation trends, and operational metrics.
 - Demonstrate how aggregate data can be used to identify capacity concerns and workflow bottlenecks.
-

Resistance Plan

Potential Concern: “This creates more work.”

Response:

- Emphasize that the dashboard reduces manual tracking and helps prioritize the most urgent cases.

- Demonstrate how documentation prompts and workflow tracking reduce the need to reconstruct case status manually.

Potential Concern: “I already have my own system.”

Response:

- Explain that the dashboard does not replace clinical judgment or personal workflow preferences.
- Position the dashboard as a coordination support tool that improves visibility and accountability.

Potential Concern: “The dashboard does not reflect the patient's true condition.”

Response:

- Reinforce that the dashboard tracks workflow status and coordination activity, not clinical stability.
 - Continue relying on clinical assessment and professional judgment for patient care decisions.
-

Success Metrics

Adoption Metrics

- Percentage of case managers actively using the dashboard.
- Number of dashboard logins per week.
- Completion rate of required documentation fields.

Workflow Metrics

- Reduction in overdue outreach attempts.
- Increase in same-day review completion following missed appointments.
- Reduction in ownership and handoff gaps.

User Feedback Metrics

- Staff satisfaction survey after 30 days.
- Feedback regarding ease of use and workflow impact.

- Suggestions for future dashboard improvements.

Expected Outcome

The dashboard should improve visibility into continuity-of-care coordination, support timely outreach and escalation activities, reduce workflow gaps, and provide case managers with a structured way to manage high-volume post-discharge caseloads.
